EDUCATION

• Bennett University

Greater Noida, India

B.Tech Computer Science, CGPA: 9.1

2021 – 2025

EXPERIENCE

• Software Engineer

Apr 2025 – Present

Cloud Victor

Bangalore, India

- Reduced AWS infrastructure spend by **40–60%** by building CUR-powered cost analyzers scanning EC2, ECR, EIP, and ElastiCache usage to detect idle and misconfigured resources.
- Built an **LLM evaluation harness** benchmarking models across **AWS Bedrock and OpenRouter** to power recommendations and remediation suggestions across every cost analyzer; selected models on an **accuracy-vs-cost** tradeoff, instrumented per-request **token and cost metrics**, and gated model promotion on eval scores measured against a labeled test set.
- Decreased automation latency from **1 hour to 10 seconds (360x faster)** by re-architecting Zoho Deluge scripts into stateless AWS Lambda microservices.
- Improved production observability across **15+ APIs** through structured logging, monitoring, and analytics instrumentation, reducing incident detection time by **30%**.
- Built the backend infrastructure powering **OpenClaw-as-a-Service**, automating provisioning of customer-isolated AWS environments using EC2, VPC, IAM, Secrets Manager, S3, encrypted EBS volumes, and first-boot bootstrap automation.
- Led company-wide adoption of **Claude Code** by designing and maintaining a centralized AI development platform, including system-wide instructions, reusable workflows, repository standards, guardrails, Markdown context files, usage analytics, and token monitoring supporting both engineering and sales teams.

• Software Engineer Intern

May 2024 – Sep 2024

Fynarfin

Bangalore, India

- Built and optimized REST APIs for Open Payments Protocol using Spring, enabling interoperable financial transactions across multiple institutions.
- Reduced cross-border payment costs by **3–5%** by integrating Mojaloop rails and optimizing transaction routing logic.
- Developed a GNAP-based authorization server to handle secure consent flows, improving authentication flexibility and reducing dependency on legacy auth systems.
- Delivered production-grade API designs and HLD documentation adopted by partner organizations for payments integration.

TECHNICAL SKILLS

Languages: Java, Python, Typescript **Backend:** REST APIs, Microservices, Distributed Systems, Event-Driven Architecture **AI Engineering:** Claude Code, Codex, OpenClaw, Prompt Engineering, AI Developer Workflows, MCP, LLM Tooling **Cloud:** AWS (Lambda, API Gateway, SNS, SQS, DynamoDB, Athena, EC2, ECR, ElastiCache, S3, IAM) **Infra:** Docker, Git, Linux, Maven, CI/CD **Other:** Mojaloop, Open Payments, GNAP, PostHog

PROJECTS

• context-find

- Built a cross-agent CLI (**TypeScript**, Ink) that searches and resumes **Claude Code** and **Codex** conversations across every working directory and machine by matching raw transcript text.
- Designed a **no-index, no-daemon** architecture scanning **300+ transcripts in ~0.2s**, searching remote hosts by piping a standard-library Python scanner over **SSH** with nothing installed on the far side.
- Enforced local/remote render parity through a **golden test suite** diffing the TypeScript and Python renderers across terminal widths, flag combinations, and both agents.

• Journal for Therapy

- Built a fully serverless backend (AWS Lambda, API Gateway, DynamoDB) supporting secure journaling and therapist-client interactions.
- Enabled **one-command infrastructure deployment** using AWS CDK, reducing environment setup time to under 5 minutes.
- Designed scalable APIs for session tracking and encrypted communication, ensuring low-latency access and data integrity.
